

Printing to a Home Printer in Vmware View

When View is launched, a feature called Thin Print will search for and install any printer that is installed on the computer you are connecting from.

The process takes about two minutes to detect and install the printers.

Once it is done, when you click “print” you will see a printer, named the same as your home printer. To verify it is correct, when it is highlighted look at the bottom of the screen. Under Model it will note “TP Output Gateway”.

Selecting that as a printer will allow you to print directly to it. Some printing options may be limited but you should be able to print your work.
